If, then, the machines are equal in phase, so that the low-tension voltages of the transformers are in series, a 110-volt lamp will just burn with its normal intensity. The procedure for switching in parallel is exactly the same here as with the previous arrangements. The connections of synchronizing lamps for three-phase current are similar to those for single-phase current. For low voltages three lamps may be connected between the terminals AA , BB , and CC (see Fig. 87). If all three lamps become simultaneously dark or bright, then the connections are all right, and at an instant of darkness the switch may be closed. It might, however, happen that on starting the machines, or after any alteration on the machine or switchboard, the lamps do Fig. 87.--Connections of Synchronizing Lamps in a Three-phase Circuit. not become or dark simultaneously, but one after the other. This is a sign that the succession of the cables on the terminals of the one machine does not correspond with the succession of the cables on the terminals of the other machine. In this case, any two of the cables may be changed. For instance, the cable which was previously connected with the switch terminal A might now be connected with B , and that of B with A . Still, in another way we can assure ourselves before starting that the cables of the two machines are correspondingly connected with the switch, viz. by switching a...
