

Operation and Care of Vehicle-Type Batteries

Filesize: 9.43 MB

Reviews

Completely essential read through ebook. This can be for all who statte there was not a well worth reading. You wont really feel monotony at at any time of your own time (that's what catalogs are for relating to if you request me).

(Maud Mitchell)

OPERATION AND CARE OF VEHICLE-TYPE BATTERIES

Rarebooksclub.com, United States, 2012. Paperback. Book Condition: New. 246 x 189 mm. Language: English . Brand New Book ***** Print on Demand *****.This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1920 Excerpt: . Ampere-hours required to produce free gassing of a lead battery at the normal starting rate of charge will be approximately 90 per cent of the Ampere-hours previously discharged. At this point the current should be cut down to the finishing rate and the charge continued until the battery begins to gas freely again. In order to obtain most efficient results with batteries of the lead-acid type, the voltage of the charging circuit should not exceed approximately 2. 5 volts per cell at normal temperatures with current flowing at one-half the value of the finishing rate at ordinary temperatures. When the voltage of the circuit exceeds this value, the maximum resistance of the rheostat must be sufficient F10. 3o.--Battery-charging circuit, constant-current method NOTE.---A=ammeter, numerals indicate range. I =voltmeter, range to suit system. to permit of a reduction in voltage to this value. It is desirable that the ampere capacity be sufficient to permit a current value of four or five times the normal, to permit of boosting (see p. 52) provided that the wiring of the charging circuit can safely carry that current. In a new installation, this condition can be provided for readily. In modifying an existing installation, the currentcapacity of the rheostat need not exceed the safe current-carrying capacity of the circuit. The effect of a voltage exceeding 2.5 volts per cell is a continuous loss during charging, in the extra amount of resistance needed to reduce the voltage to the proper value. ---
